

A general purpose weed wiper for selective herbicide applications

Microwipe is an economical and easy to use hand-held weed wiper for selective application of systemic herbicides.

- Specifically designed for the selective application of systemic herbicides
- Minimal water requirement
- Ideal for treating sensitive areas
- No contamination of soil or risk of drift
- Economical and easy to use
- Available in straight, angled or double head options

Economical weed wiper for selective applications

The hand held Microwipe has been specially developed for the selective application of systemic herbicides and is particularly suitable for herbicides containing glyphosate such as Roundup.

Highly economical and selective, the Microwipe has significant advantages over conventional methods of application including knapsack sprayers for spot applications or treating sensitive areas.

The concentrated herbicide within the Microwipe is applied only to those plants that the rope wick comes into contact with. By swiping the Microwipe over the leaves of a weed, a small dose of herbicide is transferred to the target weed only, ensuring surrounding plants remain uncontaminated.

A wide range of uses

The Microwipe is ideal for the treatment of dock leaves and thistles, as well as weeds in row crops, vegetable gardens, in between grape vines and around trees or any other situations where conventional treatment would be too dangerous or difficult. The Microwipe is also suitable for the treatment of invasive weeds.

Specification

Capacity:	0.21L
Handle material:	Clear plastic
Wick material:	Nylon
Seals:	Viton
Weight:	0.35kg
